Three steps to your dog's DNA report

Everything you need is in this box: a swab in a sealed pouch, a liquid-filled collection tube with your kit barcode on its label, and a prepaid return envelope.

1

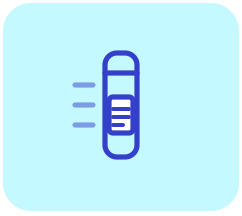

Swab your dog's cheeks

- Wait **at least two hours after your dog has eaten**, then open the swab pouch.
- Swab between the gums and cheek, **right side, then left side, about 10 seconds each**.
- Pierce the cover of the liquid-filled tube and lower the swab tip inside.
- **Snap the swab stick at the notch** (about halfway) so it fits in the tube.
- Close the tube and **mix by turning it up and down** a few times.

2

Register your kit online

- Create a free account at **my.prosperk9.com** (or sign in if you already have one).
- Click **Register Kit** and give your dog a name.
- Press **Scan** and point your phone camera at the **barcode on the tube label**, or type the code printed under it (it starts with K9):

the label on your tube; scan or type the code under the barcode

- **The kit code is only on the tube.** Barcodes on the box are shipping labels and will not register your kit.

3

Mail it back, postage is on us

- Place the closed tube in the **prepaid return envelope** provided.
- Drop it off at any **mail pickup point**. That's it!

- We'll email you when your dog's report is ready: breed ancestry, genetic health, traits, oral health, relatives, and the AI Health Advisor to answer your questions. The report is re-analysed free for the life of your dog.
